Questions:

Took a composition approach as we were working all inside the same storeview class and calling different panels as we close and open different menus throughout the jframe. When using the main menu, we can call the browse menu and cart menu from the same class using different methods.

ChangeLog

StoreView changelog:

- Added mainMenuGUI method which open JFrame with a home, browse, and cart buttons that then open the respective other menus.
- Added browseMenuGUI method which opens after browse has been clicked in the mainMenuGUI, browse has 5 images for all the fruits that are being sold with an add/subtract to cart for each fruit panel.
- Added seeCartGUI which is the menu that has all the items from browse added to it and also has the checkout buttons when user is done with the store.
